# 1 Introduction

Consilience Group Limited engaged ShellBoxes to conduct a security assessment on the Consilience beginning on September 19<sup>th</sup>, 2022 and ending October 3<sup>rd</sup>, 2022. In this report, we detail our methodical approach to evaluate potential security issues associated with the implementation of smart contracts, by exposing possible semantic discrepancies between the smart contract code and design document, and by recommending additional ideas to optimize the existing code. Our findings indicate that the current version of smart contracts can still be enhanced further due to the presence of many security and performance concerns.

This document summarizes the findings of our audit.

### 1.1 About Consilience Group Limited

Consilience Ventures is the first start-up market network to fully align the interests of start-ups, venture capital investors and experienced and talented experts to help turn innovative ideas into high-growth businesses.

lssuer	Consilience Group Limited	
Website	https://consilience.vc/	
Туре	Solidity Smart Contract	
Audit Method	Whitebox	

### 1.2 Approach & Methodology

ShellBoxes used a combination of manual and automated security testing to achieve a balance between efficiency, timeliness, practicability, and correctness within the audit's scope. While manual testing is advised for identifying problems in logic, procedure, and implementation, automated testing techniques help to expand the coverage of smart contracts and can quickly detect code that does not comply with security best practices.

### 1.2.1 Risk Methodology

Vulnerabilities or bugs identified by ShellBoxes are ranked using a risk assessment technique that considers both the LIKELIHOOD and IMPACT of a security incident. This framework is effective at conveying the features and consequences of technological vulnerabilities.

Its quantitative paradigm enables repeatable and precise measurement, while also revealing the underlying susceptibility characteristics that were used to calculate the Risk scores. A risk level will be assigned to each vulnerability on a scale of 5 to 1, with 5 indicating the greatest possibility or impact.

- Likelihood quantifies the probability of a certain vulnerability being discovered and exploited in the untamed.
- Impact quantifies the technical and economic costs of a successful attack.
- Severity indicates the risk's overall criticality.

Probability and impact are classified into three categories: H, M, and L, which correspond to high, medium, and low, respectively. Severity is determined by probability and impact and is categorized into four levels, namely Critical, High, Medium, and Low.

Impact	High	Critical	High	Medium
	Medium	High	Medium	Low
	Low	Medium	Low	Low
		High	Medium	Low

Likelihood

# 2 Findings Overview

### 2.1 Summary

The following is a synopsis of our conclusions from our analysis of the Consilience implementation. During the first part of our audit, we examine the smart contract source code and run the codebase via a static code analyzer. The objective here is to find known coding problems statically and then manually check (reject or confirm) issues highlighted by the tool. Additionally, we check business logics, system processes, and DeFi-related components manually to identify potential hazards and/or defects.

### 2.2 Key Findings

In general, these smart contracts are well-designed and constructed, but their implementation might be improved by addressing the discovered flaws, which include , 1 high-severity, 4 medium-severity, 1 low-severity vulnerabilities.

Vulnerabilities	Severity	Status
A.1. Two Members Can Lock All The Fast's Funds	HIGH	Fixed
A.2. The Issuer Can Retrieve Anyone's Tokens	MEDIUM	Acknowledged
B.1. All The Upgrades Should Be Performed Using DAO	MEDIUM	Acknowledged
C.1. One Issuer Member May Remove Any Other Issuer	MEDIUM	Fixed
Member		
D.1. The Issuer Member Can Burn The Fast's Tokens	MEDIUM	Acknowledged
B.2. The Diamond Can End Up Without An Owner	LOW	Acknowledged

# 3 Finding Details

### A FastTokenFacet.sol

### A.1 Two Members Can Lock All The Fast's Funds [HIGH]

### **Description:**

Each fast contains an attribute called transferCredits, the transfer credits are used to perform the transfer operation, whenever a fast is out of transfer credits, it becomes impossible for the member to transfer their tokens. However, this attribute depends on the fast itself and not the users, therefore the transfer credits are a shared resource between the fast members. Thus, two members can spend all the transfer credits of the fast resulting in a denial of service to all the members, locking their funds in the contract until the issuer member's intervention.

### Code:

### Listing 1: FastTokenFacet.sol

### Risk Level:

Likelihood – 5 Impact – 4

### **Recommendation:**

It is recommended to attach the transferCredits attribute to the member instead of the fast itself, or to limit the transfer credits that can be spent by one member of the fast.

### **Status** - Fixed

The Consilience team has fixed the issue by removing the transfer credits functionality.

### A.2 The Issuer Can Retrieve Anyone's Tokens [MEDIUM]

### **Description:**

The retrieveDeadTokens function allows the issuer to transfer all the tokens of any account to the reserve. This represents a significant centralization risk where the issuer has too much control over all the members' accounts.

### Code:

Listing 2:	FastTokenFacet.sol
------------	--------------------

```
function retrieveDeadTokens(address holder)
117
         external
118
         onlyIssuerMember {
119
120
       uint256 amount = balanceOf(holder);
121
122
       // Grab a pointer to the token storage.
124
       LibFastToken.Data storage s = LibFastToken.data();
125
127
           \hookrightarrow no-op.
       if (amount > 0) {
128
         // Set the holder balance to zero.
129
         s.balances[holder] = 0;
130
         // Increment the reserve's balance.
131
         s.balances[address(0)] += amount;
132
         // The tokens aren't in circulation anymore - decrease total
133
             \hookrightarrow supply.
```

s.totalSupply -= amount;

```
}
135
       // Since the holder's account is now empty, make sure to keep track
137
           \hookrightarrow of it both
       // in this FAST and in the marketplace.
138
       s.tokenHolders.remove(holder, true);
139
       MarketplaceTokenHoldersFacet(LibFast.data().marketplace).
140
           \hookrightarrow fastBalanceChanged(holder, 0);
       // This operation can be seen as a regular transfer between holder
142
           \hookrightarrow and reserve. Emit.
       emit Transfer(holder, address(0), amount);
143
       // If amount wasn't zero, total supply and reserve balance have
145
           \hookrightarrow changed - emit.
       if (amount > 0) {
146
         FastFrontendFacet(address(this)).emitDetailsChanged();
147
       }
148
     }
149
```

### Risk Level:

Likelihood – 2 Impact – 5

### **Recommendation:**

Consider using a multisig wallet or a DAO as the address of the issuer in order to avoid centralization risks and include multiple parties in the decision-making.

### Status - Acknowledged

The Consilience team has acknowledged the issue, stating that the functionality cannot be changed due to regulatory restrictions under the Financial Conduct Authority (FCA) requirements in article SUP 10A.10 Customer-dealing functions.

### B LibDiamond.sol

# B.1 All The Upgrades Should Be Performed Using DAO [MEDIUM]

### **Description:**

The contracts implement Tokenization as a Service using the diamond pattern, this implementation offers the upgradability of functionalties along with other advantages. However, by using this approach the contract owner can upgrade the contract to implement any logic, this represents a centralization risk knowing that the contract owner can change the logic of the code anytime which can cause unexpected behaviors to the users.

### Code:

### Listing 3: LibDiamond.sol

```
function diamondCut(
65
      IDiamondCut.FacetCut[] memory _diamondCut,
66
      address _init,
67
      bytes memory calldata
68
   ) internal {
69
      for (uint256 facetIndex; facetIndex < diamondCut.length; facetIndex</pre>
70
          \hookrightarrow ++) {
          IDiamondCut.FacetCutAction action = diamondCut[facetIndex].
71
              \hookrightarrow action:
          if (action == IDiamondCut.FacetCutAction.Add) {
72
              addFunctions( diamondCut[facetIndex].facetAddress,
73
                  \hookrightarrow diamondCut[facetIndex].functionSelectors);
          } else if (action == IDiamondCut.FacetCutAction.Replace) {
74
              replaceFunctions( diamondCut[facetIndex].facetAddress,
75

    diamondCut[facetIndex].functionSelectors);

          } else if (action == IDiamondCut.FacetCutAction.Remove) {
76
              removeFunctions( diamondCut[facetIndex].facetAddress,
77
                  \hookrightarrow diamondCut[facetIndex].functionSelectors);
```

```
78  } else {
79     revert("LibDiamondCut: Incorrect FacetCutAction");
80  }
81  }
82  emit DiamondCut(_diamondCut, _init, _calldata);
83  initializeDiamondCut(_init, _calldata);
84 }
```

### Risk Level:

Likelihood – 1 Impact – 4

### **Recommendation:**

Consider using a DAO as the contract owner in order to include the community in the decision of upgrades.

### Status - Acknowledged

The Consilience team has acknowledged the issue, stating that the functionality cannot be changed due to regulatory restrictions under the Financial Conduct Authority (FCA) requirements in article SUP 10A.10 Customer-dealing functions.

### B.2 The Diamond Can End Up Without An Owner [LOW]

### **Description:**

The setContractOwner allows the contract owner to delegate the ownership to another address. However, if the contract owner enters a wrong address or the address(0) as the \_newOwner, the contract will have no owner, which results in a Denial Of Service in the privileged actions.

Code:

### Listing 4: LibDiamond.sol

```
47 function setContractOwner(address _newOwner) internal {
```

```
48 DiamondStorage storage ds = diamondStorage();
```

49 address previousOwner = ds.contractOwner;

```
50 ds.contractOwner = _newOwner;
```

- emit OwnershipTransferred(previousOwner, \_newOwner);
- 52 }

### Risk Level:

Likelihood – 1 Impact – 3

### **Recommendation:**

Consider requiring the \_newOwner to be different from the address(0), and it is recommended to implement a process where the contract owner sets an address as a new owner candidate, then this address can only be the contract owner if it calls the contract to accept the ownership.

### Status - Acknowledged

The Consilience team has acknowledged the issue, stating that they want ownership to be transferable to the address(0) as a proof of future immutability.

### C IssuerAccessFacet.sol

### C.1 One Issuer Member May Remove Any Other Issuer Member [MEDIUM]

### **Description:**

The removeMember function can be called by any member. Allowing a member to remove another one with the same privilege can harm the logic of the contract. For in instance, a

new issuer member will be able to remove all the other members.

### Code:

```
Listing 5: IssuerAccessFacet.sol

73 function removeMember(address member)
74 external override
75 onlyMember(msg.sender) {
76 // No suicide allowed.
77 if (msg.sender == member) {
78 revert ICustomErrors.CannotSelfRemove(msg.sender);
79 }
80 // Remove the member from the set.
81 LibIssuerAccess.data().memberSet.remove(member, false);
82 // Emit!
83 emit MemberRemoved(member);
84 }
```

### Risk Level:

Likelihood – 2 Impact – 4

### **Recommendation:**

Consider restricting the functionality to one master issuer member that will have a higher privilege over the other members.

### **Status - Fixed**

The Consilience team has fixed the issue by only allowing the diamond owner to remove the issuer members.

### D FastTokenFacet.sol

### D.1 The Issuer Member Can Burn The Fast's Tokens [MEDIUM]

### **Description:**

Anyone of the issuer members is able to burn tokens from the reserve, this action can represent a significant centralization risk where the issuer members have too much control over the fast's funds.

### Code:

```
Listing 6: FastTokenFacet.sol
19 function burn(uint256 amount, string calldata ref)
     external
80
     onlyIssuerMember {
81
  LibFastToken.Data storage s = LibFastToken.data();
82
   if (FastTopFacet(address(this)).hasFixedSupply()) {
84
     revert ICustomErrors.RequiresContinuousSupply();
85
  }
86
  // Remove the minted amount from the zero address.
88
s.balances[address(0)] -= amount;
  // Keep track of the minting operation.
91
92 FastHistoryFacet(address(this)).burnt(amount, ref);
94 // Emit!
95 FastFrontendFacet(address(this)).emitDetailsChanged();
% emit Burnt(amount, ref);
97 }
```

### Risk Level:

Likelihood – 2 Impact – 4

### **Recommendation:**

Consider adding some restrictions to the burn functionality to limit the power of the issuer members over the fasts.

### Status - Acknowledged

The Consilience team has acknowledged the issue, stating that the functionality cannot be changed due to regulatory restrictions under the Financial Conduct Authority (FCA) requirements in article SUP 10A.10 Customer-dealing functions.

# 4 Attack Scenarioes

### 4.1 Issuer

🟦 Registering a fast without being an issuer member

- X FAILED
- **Protection by the onlyMember modifier**
- 🟦 Adding/Removing Issuer members without being an issuer member
  - X FAILED
  - **Protection by the onlyMember modifier**
- 🟦 Adding/Removing Issuer members being an issuer member
  - PASSED
  - The onlyMember modifier is not enough as all the members have the same privilege over each other

Adding/Removing a fast governor directly from the fastGovernorships mapping in the Issuer diamond without calling the Fast

- X FAILED
- Having in place a check that makes sure governorAddedToFast and governorRemovedFromFast can only be called by a registered Fast

### 4.2 Fast

- 🟦 Minting an amount without being an issuer member
  - X FAILED
  - **Protection by the onlyIssuerMember modifier**

- ${f \hat{\pi}}$  Minting more than one time in a fast that has a fixed supply
  - X FAILED
  - Having in place a check that makes sure the mint can only be performed one time in a fixed supply fast.
- 🕱 Burning an amount without being an issuer member
  - X FAILED
  - **Protection by the onlyIssuerMember modifier**
- $\hat{\boldsymbol{x}}$  Burning in a fast that has a fixed supply
  - X FAILED
  - Having a check in place that makes sure the burn can only be performed in a continuous supply fast.
- 🟦 Causing an overflow/underflow and generating unexpected results
  - X FAILED
  - **Q** Built in overflow protection in solidity 0.8.\* versions
- Approve Race Condition
  - X FAILED
  - **?** The allowance is incremented instead of being set to amount
- ${f \hat{\pi}}$  Transferring tokens to a non-fast-member in a private fast
  - X FAILED
  - **?** The onlyTokenHolder modifier requires the from and to to be fast members when the fast is private

- ${f \hat{\pi}}$  Transferring tokens to a non-marketplace-member in a semi public fast
  - X FAILED
  - **?** The onlyTokenHolder modifier requires the to to be a marketplace member when the fast is semi public
- ${f \hat{\pi}}$  Transferring tokens from the reserve without being a fast governor
  - X FAILED
  - The transfer function verifies the spender to be a fast governor whenever the from is the reserve address
- 🟦 Performing a transfer without having enough transfer credits
  - X FAILED
  - ${f Q}$  The transfer call fails due to underflow protection
- 🟦 Changing a fast from semi public to private
  - X FAILED
  - **?** The setIsSemiPublic function prevents the change when a fast is semi public
- 🟦 Adding/Removing governors without being an issuer member
  - X FAILED
  - **Protection by the onlyIssuerMember modifier**
- Adding/Removing fast members without being a governor
  - X FAILED
  - **Protection by the onlyGovernor modifier**

- 🕱 Adding a non-marketplace-member as a fast member
  - X FAILED
  - **Protection by onlyMarketplaceMember modifier**
- 🟦 Spending all the transfer credits by one member
  - X FAILED
  - **?** The member is limited with his token balance
- 🕱 Spending all the transfer credits by two members
  - PASSED
  - Two members can spend all the transfer credits by performing multiple transfer calls between each other

### 4.3 Marketplace

- 🟦 Adding/Removing marketplace members without being an issuer member
  - X FAILED
  - **Protection by the onlyIssuerMember modifier**

Adding/Removing a fast member directly from the fastMemberships mapping in the Marketplace diamond without calling the Fast

- X FAILED
- Having in place a check that makes sure memberAddedToFast and memberRemovedFromFast can only be called by a registered Fast

Manipulating the fastHoldings mapping in the Marketplace diamond without calling the Fast

- X FAILED
- P Having in place a check that makes sure fastBalanceChanged can only be called by a registered Fast

### Conclusion:

The results of the attack scenarios are mentionned in the Finding Details section, the contracts were also tested for reentrancy attacks, front running attacks, Block Timestamp manipulation..., and no issues were found.

# 5 Best Practices

### **BP.1 Unnecessary Initializations**

### **Description:**

When a variable is declared in solidity, it gets initialized with its type's default value. Thus, there is no need to initialize a variable with the default value.

### Code:

Listing 7: FastInitFacet.sol

- 87 tokenData.totalSupply = 0;
- 88 // Initialize other internal stuff.
- \*\* tokenData.transferCredits = 0;

### **BP.2** Unnecessary Argument

### **Description:**

The setIsSemiPublic function is used to change the fast's type. However, the fast's type can only be changed from private to semi-public, therefore the flag argument is unnecessary since the isSemiPublic attribute can be set directly to true in order to change the fast's type from private to semi-public.

### Code:

### Listing 8: FastTopFacet.sol

```
57 function setIsSemiPublic(bool flag)
```

```
58 external
```

- 59 onlyIssuerMember { // can be set to true
- 60 // Someone is trying to toggle back to private?... No can do!
- 61 if (this.isSemiPublic()) {

```
62 revert ICustomErrors.UnsupportedOperation();
63 }
64 LibFast.data().isSemiPublic = flag;
65 // Emit!
66 FastFrontendFacet(address(this)).emitDetailsChanged();
```

67 }

# 6 Tests

### **Results:**

FastAccessFacet IHasGovernors implementation isGovernor returns true when the address is a governor returns false when the address is not a governor governorCount returns the current count of governors paginateGovernors returns the cursor to the next page does not crash when overflowing and returns the correct cursor returns the governors in the order they were added addGovernor requires Issuer membership (anonymous) (42ms) requires Issuer membership (governor) delegates to the Issuer for permission checking requires that the address is an Marketplace member requires that the address is not a governor yet (52ms) adds the given address as a governor (49ms) calls FastFrontendFacet.emitDetailsChanged emits a GovernorAdded event removeGovernor requires Issuer membership (anonymous) requires Issuer membership (governor) delegates to the Issuer for permission checking requires that the address is an existing governor removes the given address as a governor (51ms) calls FastFrontendFacet.emitDetailsChanged emits a GovernorRemoved event

### IHasMembers

isMember

returns true when the address is a member returns false when the address is not a member memberCount returns the current count of members paginateMembers returns the cursor to the next page does not crash when overflowing and returns the correct cursor returns the members in the order they were added addMember requires governance (anonymous) requires governance (Issuer governor) requires that the address is an Marketplace member requires that the address is not a member yet (57ms) adds the given address as a member (43ms) delegates to the Marketplace contract to signal the membership  $\hookrightarrow$  addition calls FastFrontendFacet.emitDetailsChanged emits a MemberAdded event removeMember requires governance (anonymous) requires governance (Issuer governor) requires that the address is an existing member removes the given address as a member delegates to the token contract (40ms) delegates to the Marketplace contract to signal the membership  $\hookrightarrow$  addition calls FastFrontendFacet.emitDetailsChanged (41ms) emits a MemberRemoved event flags is accurate when all flags set (83ms) is accurate when only isGovernor is set (39ms) is accurate when only isMember is set (64ms)

is accurate when no flags are set (42ms)

#### FastFrontendFacet

emitDetailsChanged

requires that the caller is the diamond

emits a DetailsChanged event with all the correct information details

returns a populated details struct

detailedMember

returns a MemberDetails struct with the correct information detailedGovernor

returns a GovernorDetails struct with the correct information paginateDetailedMembers

returns member details with next cursor

handles an offset index cursor

paginateDetailedGovernors

returns governor details with next cursor

#### FastHistoryFacet

#### minted

requires that the caller is the token (anonymous) requires that the caller is the token (governor) as the diamond

adds an entry to the supply proof list

#### $\mathtt{burnt}$

requires that the caller is the diamond (anonymous)

requires that the caller is the diamond (governor)

as the diamond

adds an entry to the supply proof list

#### supplyProofCount

counts how many supply proofs have been stored

paginateSupplyProofs

returns the cursor to the next page

does not crash when overflowing and returns the correct cursor returns the supply proofs in the order they were added

transfered

requires that the caller is the token (anonymous) requires that the caller is the token (governor) adds an entry to the transfer proof list (76ms)

 ${\tt transfer} {\tt ProofCount}$ 

counts how many transfer proofs have been stored (88ms) paginateTransferProofs

returns the cursor to the next page

does not crash when overflowing and returns the correct cursor returns the transfer proofs in the order they were added paginateTransferProofsByInvolvee

returns the cursor to the next page

- does not crash when overflowing and returns the correct cursor (  $\hookrightarrow$  bob)
- does not crash when overflowing and returns the correct cursor (  $\hookrightarrow$  john)
- counts the proofs regardless of the involvement (sender and  $\hookrightarrow$  recipient)

categorizes the proofs for the senders

paginateTransferProofIndicesByInvolvee

returns a paginated list of addresses and cursor

transferProofByInvolveeCount

returns the count of the transfer proofs for a given address

#### FastTokenFacet

#### initialize

```
keeps track of the ERC20 parameters and extra ones (40ms) name
```

returns the name

#### symbol

```
returns the symbol
```

#### decimals

returns the decimals

#### totalSupply

returns the total supply

```
transferCredits
```

```
returns the remaining transfer credits
mint
  requires Issuer membership (anonymous)
  requires Issuer membership (member)
  requires Issuer membership (governor)
  delegates to the history contract (48ms)
  adds the minted tokens to the zero address (59ms)
  does not impact total supply (61ms)
  emits a Minted event (53ms)
  - delegates to the frontend facet
  with fixed supply
    is allowed only once (73ms)
 with continuous supply
    is allowed more than once (99ms)
burn
  requires Issuer membership (anonymous)
  requires Issuer membership (member)
  requires Issuer membership (governor)
  requires that the supply is continuous
  requires that the zero address has enough funds
  removes tokens from the zero address (56ms)
  does not impact total supply (48ms)
  delegates to the history contract
  emits a Burnt event (38ms)
  - delegates to the frontend facet
retrieveDeadTokens
  requires Issuer membership
  still emits a Transfer event if the balance was already zero
  sets the holder balance to zero while increasing the reserve
      \hookrightarrow balance (66ms)
  decreases the total supply by the amount (47ms)
  removes the holder from the FAST token holder list (43ms)
  calls the marketplace to stop tracking this token holder for this
```

 $\hookrightarrow$  FAST

emits a Transfer event between the holder and the reserve

delegates to the Frontend facet for a global event emission (40ms) addTransferCredits

requires Issuer membership (anonymous)
requires Issuer membership (member)
requires Issuer membership (governor)
accumulates the credits to the existing transfer credits (103ms)
emits a TransferCreditsAdded event

- delegates to the frontend facet

drainTransferCredits

requires Issuer membership (anonymous) requires Issuer membership (member) requires Issuer membership (governor) sets the credit amount to zero (61ms)

emits a TransferCreditsDrained event (38ms)

ERC20

balanceOf

returns the amount of tokens at a given address

transfer

delegates to the internal performTransfer method (115ms) transferWithRef

delegates to the internal performTransfer method (78ms) allowance

returns the allowance for a given member (44ms)

follows value at zero address for governors (76ms)

#### approve

delegates to the internal performApproval method requires FAST membership adds an allowance with the correct parameters (117ms) functions properly when given a zero amount (97ms) stacks up new allowances (105ms) keeps track of given allowances (47ms) keeps track of received allowances (48ms) emits an Approval event

disapprove

delegates to the internal Disapproval method

subtracts from the existing allowance

emits a Disapproval event

when the allowance remains positive after the operation removes the spender received allowance when it reaches zero removes the original given allowance when it reaches zero when the allowance reaches zero

removes the spender received allowance when it reaches zero removes the original given allowance when it reaches zero transferFrom

delegates to the internal performTransfer method (79ms) transferFromWithRef

delegates to the internal performTransfer method (85ms) decreases the transfer credits when not transacting from the

 $\hookrightarrow$  zero address (128ms) requires that the sender and recipient are different requires sufficient funds (83ms)

requires sufficient transfer credits (129ms)

transfers from / to the given wallet address (132ms)

delegates to the history contract (76ms)

delegates to the MarketplaceTokenHoldersFacet contract (76ms) updates who holds this token (87ms)

decreases total supply when transferring to the zero address  $\hookrightarrow$  (112ms)

emits a IERC20.Transfer event (90ms)

requires that there is enough allowance (52ms)

allows non-members to transact on behalf of members (189ms)

increases total supply when transferring from the zero address

 $\hookrightarrow$  (96ms)

requires that zero address can only be spent from as a governor  $\hookrightarrow$  (Issuer member) (48ms)

requires that zero address can only be spent from as a governor

 $\hookrightarrow$  (member) (43ms)

requires that zero address can only be spent from as a governor  $\hookrightarrow$  (anonymous) (120ms) allows governors to transfer from the zero address (151ms) does not require transfer credits when drawing from the zero  $\hookrightarrow$  address (126ms) does not impact transfer credits when drawing from the zero  $\hookrightarrow$  address (165ms) when member deactivated requires active member when transferring from address (at the  $\hookrightarrow$  Marketplace level) (55ms) allows transfer to a deactived member (at the Marketplace  $\hookrightarrow$  level) (155ms) when semi-public requires sender membership (Marketplace membership) requires recipient membership (Marketplace membership) (40ms) allows marketplace members to transact (169ms) when private requires sender membership (FAST member) requires recipient membership (FAST member) (54ms) givenAllowanceCount returns the count of allowancesByOwner paginateAllowancesByOwner returns the list of addresses to which the caller gave allowances  $\hookrightarrow$  to does not list addresses from which the caller has received  $\hookrightarrow$  allowances receivedAllowanceCount returns the count of allowancesBySpender paginateAllowancesBySpender returns the list of addresses to which the caller gave allowances  $\hookrightarrow$  to does not list addresses to which the caller has given allowances

before Removing Member

cannot be called directly

when successful

#### FastTopFacet

#### issuerAddress

returns the Issuer address

marketplaceAddress

returns the marketplace address

#### ${\tt isSemiPublic}$

returns the FAST semi-public parameter

#### hasFixedSupply

returns the FAST fixed supply parameter

#### setIsSemiPublic

requires Issuer membership for the sender delegates to the Issuer for permission check (39ms) prevents changing from semi-public to closed (73ms) sets the required flag on the FAST (47ms) delegates to FastFrontendFacet.emitDetailsChanged (41ms)

#### IssuerAccessFacet

#### IHasMembers

#### isMember

returns true when the candidate is a member

returns false when the candidate is not a member

memberCount

correctly counts members

paginateMembers

returns pages of members (54ms)
addMember

requires that the sender is a member

adds the member to the list

does not add the same member twice

emits a MemberAdded event

removeMember

requires that the sender is a member

requires that the user is not removing themselves

removes the member from the list

reverts if the member is not in the list

emits a MemberRemoved event

#### governorAddedToFast

requires the caller to be a registered FAST

adds the given member to the FAST governorship tracking data

 $\hookrightarrow$  structure (66ms)

emits GovernorshipAdded event (55ms)

governorRemovedFromFast

requires the caller to be a registered FAST

adds the given member to the FAST governorship tracking data

 $\hookrightarrow$  structure (92ms)

emits GovernorshipRemoved event (77ms)

paginateGovernorships

given an address, returns the list of FASTs that it is a governor  $\hookrightarrow$  of

### ${\tt IssuerFrontendFacet}$

paginateDetailedFasts

returns a paginated list of detailed FAST details (45ms)

# IssuerInitFacet

## initialize

requires that it is not initialized set various storage versions registers supported interfaces (50ms) adds the given address to the member list emits a MemberAdded event

### IssuerTopFacet

FAST management

isFastRegistered

returns false when the FAST symbol is unknown

returns true when the FAST symbol is registered

#### fastBySymbol

returns the zero address when the FAST symbol is unknown returns the FAST address when the FAST symbol is registered

#### registerFast

requires Issuer membership

reverts if trying to add a FAST with an already existing symbol  $\hookrightarrow$  (50ms)

adds the registry address to the list of registries

keeps track of the symbol

emits a FastRegistered event

## fastCount

returns the FAST count

paginateFasts

returns pages of FASTs

#### MarketplaceAccessFacet

## IHasMembers

# ${\tt isMember}$

returns true when the address is a member

returns false when the address is not a member

#### memberCount

returns the current count of members

#### paginateMembers

returns the cursor to the next page

does not crash when overflowing and returns the correct cursor

returns the governors in the order they were added

addMember

requires Issuer membership (anonymous)

delegates to the Issuer for permission (42ms) requires that the address is not a member yet (76ms) adds the given address as a member (59ms) emits a MemberAdded event removeMember requires Issuer membership (anonymous) delegates to the Issuer for permission requires that the address is an existing member - calls  $\hookrightarrow$  LibAddressSet requires that the given member has no FAST memberships (85ms) removes the given address as a member (59ms) emits a MemberRemoved event (40ms) fastMemberships returns an array of FASTs a given user belongs to along with a  $\hookrightarrow$  cursor does not return FASTs the given user does not belong to memberAddedToFast requires the caller to be a registered FAST adds the given member to the FAST membership tracking data  $\hookrightarrow$  structure (62ms) memberRemovedFromFast requires the caller to be a registered FAST removes the FAST contract from the list of Fast members (95ms) isMemberActive returns true when a member is active returns false when a member is deactived deactivateMember requires the caller to be an Issuer member requires the member to deactivate is an Marketplace member adds the FAST member to the list of deactivated members (65ms) emits a MemberDeactivated event (49ms) requires that a given member is not already deactivated (94ms)

#### activateMember

## MarketplaceInitFacet

## initialize

requires that it is not initialized (147ms) set various storage versions registers supported interfaces (92ms) stores the given Issuer address

## MarketplaceTokenHoldersFacet

#### holdingsUpdated

reverts if not called by a FAST contract returns a list of FASTs that an account holds (64ms) removes the FAST holding if account balance drops to 0 (93ms) does not track the zero address (46ms)

### holdings

returns a list of FASTs a account holds (60ms)

#### MarketplaceTopFacet

# issuerAddress

returns the Issuer address

#### 270 passing (2m)

4 pending

# 7 Coverage

# 8 Static Analysis (Slither)

# **Description:**

ShellBoxes expanded the coverage of the specific contract areas using automated testing methodologies. Slither, a Solidity static analysis framework, was one of the tools used. Slither was run on all-scoped contracts in both text and binary formats. This tool can be used to test mathematical relationships between Solidity instances statically and variables that allow for the detection of errors or inconsistent usage of the contracts' APIs throughout the entire codebase.

# **Results**:

```
'npx hardhat compile --force' running
Generating typings for: 45 artifacts in dir: typechain for target:
   \hookrightarrow ethers-v5
Successfully generated 90 typings!
Compiled 45 Solidity files successfully

  - FastTokenFacet.allowance(address,address) (contracts/fast/
    - $\hookrightarrow$  FastTokenFacet.sol#276-288)
- . analyzed (45 contracts with 72 detectors), 135 result(s) found

# Conclusion:

Most of the vulnerabilities found by the analysis have already been addressed by the smart contract code review.

# 9 Conclusion

In this audit, we examined the design and implementation of Consilience contract and discovered several issues of varying severity. Consilience Group Limited team addressed 2 issues raised in the initial report and implemented the necessary fixes, while acknowledging the rest due to legal and business logic requirements.

# 10 Disclaimer

Shellboxes reports should not be construed as "endorsements" or "disapprovals" of particular teams or projects. These reports do not reflect the economics or value of any "product" or "asset" produced by any team or project that engages Shellboxes to do a security evaluation, nor should they be regarded as such. Shellboxes Reports do not provide any warranty or guarantee regarding the absolute bug-free nature of the examined technology, nor do they provide any indication of the technology's proprietors, business model, business or legal compliance. Shellboxes Reports should not be used in any way to decide whether to invest in or take part in a certain project. These reports don't offer any kind of investing advice and shouldn't be used that way. Shellboxes Reports are the result of a thorough auditing process designed to assist our clients in improving the quality of their code while lowering the significant risk posed by blockchain technology. According to Shellboxes, each business and person is in charge of their own due diligence and ongoing security. Shellboxes does not guarantee the security or functionality of the technology we agree to research; instead, our purpose is to assist in limiting the attack vectors and the high degree of variation associated with using new and evolving technologies.
